Abstract

The Help and Support Portal is a front-end web application designed to assist individuals in providing and seeking help through donations and small loans. The platform enables users to either request assistance or contribute voluntarily, fostering a community-driven support ecosystem. Developed using HTML, CSS, and JavaScript, this platform demonstrates a user-friendly interface that facilitates the submission and display of donation and loan requests. The project aims to highlight how technology can be leveraged to build compassion-based online systems and encourage social welfare.

Help and Support Portal

1. INTRODUCTION

2. The Help and Support Portal is designed to create a bridge between donors and individuals in need. In modern society, access to financial support or small-scale assistance can make a significant difference in people's lives. Existing donation platforms focus primarily on monetary aid, whereas this portal expands the scope by allowing people to also request loans for temporary needs. The system's main objective is to provide a transparent and simple interface where users can either give or take help in the form of donations or loans.

This project was built using front-end web technologies — HTML, CSS, and JavaScript — ensuring accessibility, clean design, and responsiveness. It can be further extended with a backend system to store and process real-time data. This version serves as a prototype demonstrating the potential of online community-based mutual support systems.

Literature Survey

3. Several online platforms such as GoFundMe, Milaap, and Ketto provide donation-based crowdfunding solutions, where users can create campaigns and receive help. However, few address the concept of peer-to-peer lending within a unified interface. Our project takes inspiration from these donation systems and extends it to incorporate loan requests, enabling users to either donate money freely or offer repayable loans to verified individuals.

This model encourages a culture of trust and support within a community. It also promotes social empathy while demonstrating how even basic web technologies can create impactful, accessible systems.

4. METHODOLOGY

5. The website was developed using standard front-end technologies. HTML provides the structure, CSS handles layout and design, and JavaScript adds interactive functionality. The core components of the system are:
 1. Home Page – Introduces the platform and displays the available options for donation and loan requests.
 2. Donation Form – Allows users to enter their name, donation amount, and a message.
 3. Loan Request Form – Enables users to specify their name, required loan amount, and reason.
 4. Submission Logic – JavaScript handles dynamic display of submitted requests in real-time within the same page.

The design emphasizes simplicity and responsiveness to ensure usability across various devices. Data persistence is not implemented since this version focuses purely on front-end development.

6. EXPERIMENTS

7. The experimental phase involved testing the visual layout, user input forms, and submission flow of the website. Screenshots below demonstrate the core pages of the project, including the homepage, donation page, and loan request form.

The screenshot displays a web browser window with the address bar showing 'donation-loan-webpage.vercel.app'. The page has a dark blue header with the title 'Help & Support Community Platform' and the subtitle 'Donate or Provide Loans to People in Need'. The main content area is light gray and contains two white form boxes. The first box, titled 'Give a Donation', has fields for 'Your Name' (with placeholder 'Enter your name'), 'Amount (₹)' (with placeholder 'Enter amount'), and 'Message' (with placeholder 'Write a message'), followed by a green 'Submit Donation' button. The second box, titled 'Request a Loan', has a 'Your Name' field (with placeholder 'Enter your name').

16. RESULTS

17. The project successfully demonstrates a functional prototype for an online help and support platform. Users can visually experience how donation and loan requests are made, submitted, and displayed dynamically. Although the system

currently operates only on the client side, it effectively showcases the potential of a complete platform for financial assistance exchange.

18. CONCLUSION AND FUTURE WORK

19. In conclusion, the Help and Support Portal serves as an effective front-end demonstration of a community-driven platform that enables users to both seek and provide financial help. The intuitive interface allows smooth navigation and interaction, making the idea accessible to people of all backgrounds.

In the future, this project can be enhanced with backend integration to store data securely, implement authentication systems, and process real transactions. Additional features like an admin dashboard, chat system, and reputation scoring can further improve trust and functionality.
